To determine when to show a new wind generation facility as being part of our "nameplate inventory" we monitor the actual output of pending new wind gen facilities. When a new facility shows actual generation more than half of their pending nameplate capacity, then we add the full nameplate capacity of the new wind facility to the two externally posted wind gen plots and this data table. This is not a perfect science, and we do not wish to show the nameplate capacity as being truly "in place" while a new facility is still in the early stages of development/testing.

Note that movements of wind generation facilities out of the BPA Balancing Authority Area are shown as negative increments to capacity.
